

# Dunder Methods in Python

## Important Dunder Methods (Real-World Usage)

■ `__init__`

■ `__str__`

■ `__repr__`

■ `__len__`

■ `__getitem__`

■ `__setitem__`

■ `__add__`

■ `__eq__`

■ `__call__`

■ `__enter__`

■ `__exit__`

■ `__iter__`

■ `__next__`

## All Common Dunder Methods

`__new__` — Creates new instance.

`__init__` — Initializes object.

`__del__` — Destructor.

`__str__` — User string representation.

`__repr__` — Developer string representation.

`__len__` — Length of object.

`__getitem__` — Indexing support.

`__setitem__` — Item assignment.

`__delitem__` — Item deletion.

`__iter__` — Iterator protocol.

`__next__` — Next item in iteration.

`__contains__` — Membership test.  
`__add__` — Addition operator.  
`__sub__` — Subtraction operator.  
`__mul__` — Multiplication operator.  
`__truediv__` — Division operator.  
`__floordiv__` — Floor division.  
`__mod__` — Modulo operator.  
`__pow__` — Power operator.  
`__eq__` — Equality comparison.  
`__ne__` — Not equal.  
`__lt__` — Less than.  
`__le__` — Less than or equal.  
`__gt__` — Greater than.  
`__ge__` — Greater than or equal.  
`__hash__` — Hash value.  
`__bool__` — Boolean value.  
`__call__` — Callable object.  
`__enter__` — Context manager enter.  
`__exit__` — Context manager exit.  
`__getattr__` — Attribute not found.  
`__setattr__` — Set attribute.  
`__delattr__` — Delete attribute.  
`__int__` — Integer conversion.  
`__float__` — Float conversion.  
`__format__` — String formatting.
